

1.2: The Language of Sets

Definition.

- A **set** is a collection of objects.
- If S is a set, then we use
 - $x \in S$ to denote that the element x is in the set S .
 - $x \notin S$ to denote that the element x is *not* in the set S .
- The **set-roster notation** is used to denote all elements in a set between braces:

$$S = \{1, 2, \dots, 100\}$$

Here, we see that $67 \in S$, but $1337 \notin S$.

- The **axiom of extension** says that a set is completely determined by what its elements are – not the order in which they are listed.

Example.

Let $A = \{1, 2, 3\}$, $B = \{3, 1, 2\}$, and $C = \{1, 1, 2, 3, 3, 3\}$. What are the elements of A , B , and C ? How are A , B , and C related?

A, B, and C all have the same elements. A, B, and C are equivalent sets

Is $\{0\} = 0$?

No

How many elements are in the set $\{1, \{1\}\}$?

2

For each nonnegative integer n , let $U_n = \{n, -n\}$. Find U_1 , U_2 , and U_0 .

$$U_1 = \{1, -1\} \quad U_2 = \{2, -2\} \quad U_0 = \{0, -0\} = \{0\}$$

Certain sets of numbers are so frequently referred to that they are given special names and symbols:

N or \mathbb{N} The set of all **natural numbers**

Z or \mathbb{Z} The set of all **integers**

Q or \mathbb{Q} The set of all **rational numbers**, or quotient of integers

R or \mathbb{R} The set of all **real numbers**

Note: We may additionally use superscripts to indicate further properties of these sets:

\mathbb{Z}^+ or $\mathbb{Z}^{>0}$ The set of *positive* integers

\mathbb{Q}^- or $\mathbb{Q}^{<0}$ The set of *negative* rational numbers

\mathbb{R}^{nonneg} or $\mathbb{R}^{\geq 0}$ The set of *nonnegative* real numbers

Note: Different sources denote the natural numbers \mathbb{N} as \mathbb{Z}^+ or $\mathbb{Z}^{\geq 0}$.

$$\mathbb{N} = \{1, 2, 3, \dots\}$$

$$\mathbb{Z} = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$$

$$\mathbb{Q} = \left\{ x \mid x = \frac{a}{b}, a, b \in \mathbb{Z}, b \neq 0 \right\}$$

Definition. (Set-Builder Notation)

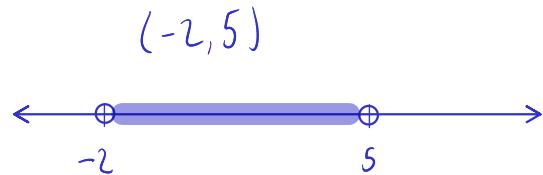

Let S be a set and let $P(x)$ be a property that elements of S may or may not satisfy. We may define a new set to be **the set of all elements x in S such that $P(x)$ is true**. We denote this set as follows:

$$\{x \in S \mid P(x)\}$$

↑ ↑
the set of all such that

Example. Describe each of the following sets:

$$\{x \in \mathbb{R} \mid -2 < x < 5\} \text{ All real numbers between } -2 \text{ and } 5, \text{ excluding } -2 \text{ and } 5.$$

$$\{x \in \mathbb{Z} \mid -2 < x < 5\}$$

$$= \{-1, 0, 1, 2, 3, 4\}$$

$$\{x \in \mathbb{Z}^+ \mid -2 < x < 5\}$$

$$= \{1, 2, 3, 4\}$$

Definition.

If A and B are sets, then A is called a **subset** of B , written $A \subseteq B$, if, and only if, every element of A is also an element of B :

$A \subseteq B$ means that for every element x , if $x \in A$, then $x \in B$.

$A \not\subseteq B$ means that there is at least one element x , such that $x \in A$ and $x \notin B$.

A is a **proper subset** of B if, and only if, every element of A is in B , but there is at least one element of B that is not in A :

$A \subsetneq B$ means that for every element x , if $x \in A$, then $x \in B$,
and there exists $x \in B$ such that $x \notin A$.

Example. Let $A = \mathbb{Z}^+$, $B = \{n \in \mathbb{Z} \mid 0 \leq n \leq 100\}$, and $C = \{100, 200, 300, 400, 500\}$. Evaluate the truth and falsity of each of the following statements.

$B \subseteq A$ False; $0 \in B$, but $0 \notin A$

C is a proper subset of A True

C and B have at least one element in common True

$C \subseteq B$ False; $200 \in C$, but $200 \notin B$

$C \subseteq C$ True

Example. Determine which of the following statements are true:

$$2 \in \{1, 2, 3\}$$

True

$$\{2\} \in \{1, 2, 3\}$$

False

$$2 \subseteq \{1, 2, 3\}$$

False

$$\{2\} \subseteq \{1, 2, 3\}$$

True

$$\{2\} \subseteq \{\{1\}, \{2\}\}$$

False

$$\{2\} \in \{\{1\}, \{2\}\}$$

True

Definition.

Given elements a and b , the symbol (a, b) denotes the **ordered pair** consisting of a and b together with the specification that a is the first element of the pair, and b is the second element. Two ordered pairs (a, b) and (c, d) are equal if, and only if, $a = c$ and $b = d$:

$$(a, b) = (c, d) \text{ means that } a = c \text{ and } b = d.$$

Example.

Is $(1, 2) = (2, 1)$?

No

Is $\left(3, \frac{5}{10}\right) = \left(\sqrt{9}, \frac{1}{2}\right)$?

Yes

Definition.

Let $n \in \mathbb{N}$ and let x_1, x_2, \dots, x_n be (not necessarily distinct) elements. The **ordered n -tuple**, (x_1, x_2, \dots, x_n) , consists of x_1, x_2, \dots, x_n together with the ordering: first x_1 , then x_2 , and so forth up to x_n . An ordered 2-tuple is called an **ordered pair**, and an ordered 3-tuple is called an **ordered triple**.

Two ordered n -tuples (x_1, x_2, \dots, x_n) and (y_1, y_2, \dots, y_n) are **equal** if, and only if, $x_1 = y_1, x_2 = y_2, \dots$, and $x_n = y_n$:

$$(x_1, x_2, \dots, x_n) = (y_1, y_2, \dots, y_n) \iff x_1 = y_1, x_2 = y_2, \dots, x_n = y_n.$$

Example.

Is $(1, 2, 3, 4) = (1, 2, 4, 3)$?

No

Is $\left(3, (-2)^2, \frac{1}{2}\right) = \left(\sqrt{9}, 4, \frac{3}{6}\right)$?

Yes

Definition.

Given sets A_1, A_2, \dots, A_n , the **Cartesian product** of A_1, A_2, \dots, A_n , denoted

$$A_1 \times A_2 \times \cdots \times A_n$$

is the set of all ordered n -tuples (a_1, a_2, \dots, a_n) where $a_1 \in A_1, a_2 \in A_2, \dots, a_n \in A_n$:

$$A_1 \times A_2 \times \cdots \times A_n = \{(a_1, a_2, \dots, a_n) \mid a_1 \in A_1, a_2 \in A_2, \dots, a_n \in A_n\}$$

Example. Let $A = \{x, y\}$, $B = \{1, 2, 3\}$, and $C = \{a, b\}$. Find the following:

$$A \times B = \{(x, 1), (x, 2), (x, 3), (y, 1), (y, 2), (y, 3)\}$$

$$B \times A = \{(1, x), (2, x), (3, x), (1, y), (2, y), (3, y)\}$$

$$A \times A = \{(x, x), (x, y), (y, x), (y, y)\}$$

How many elements are in $A \times B$, $B \times A$, and $A \times A$?

6 6 4

$$(A \times B) \times C = \{(x, 1, a), (x, 1, b), (x, 2, a), (x, 2, b), (x, 3, a), (x, 3, b), (y, 1, a), (y, 1, b), (y, 2, a), (y, 2, b), (y, 3, a), (y, 3, b)\}$$

$$A \times B \times C = \{(x, 1, a), (x, 1, b), (x, 2, a), (x, 2, b), (x, 3, a), (x, 3, b), (y, 1, a), (y, 1, b), (y, 2, a), (y, 2, b), (y, 3, a), (y, 3, b)\}$$

Describe $\mathbb{R} \times \mathbb{R}$

The Cartesian plane we use for graphing

Definition.

Let $n \in \mathbb{N}$. Given a finite set A , a **string of length n over A** is an ordered n -tuple of elements of A written without parentheses or commas. The elements of A are called the **characters** of the string. The **null string** over A is defined to be the “string” with no characters, often denoted λ , and is said to have length 0. If $A = \{0, 1\}$, then a string over A is called a **bit string**.

Example. Let $A = \{a, b\}$. List all strings of length 3 over A with at least two characters that are the same.

aaa, aab, aba, abb, baa, bab, bba, bbb
