

3.2: Quadratic functions

Definition.

A quadratic is a function of degree two. The **general form of a quadratic function** is

$$f(x) = ax^2 + bx + c \quad (a \neq 0)$$

where a , b , and c represent constants. The **standard form of a quadratic** is

$$f(x) = a(x - h)^2 + k.$$

A **parabola** is the shape of the graph of a quadratic function, with a vertex at (h, k) :

$$h = -\frac{b}{2a}, \quad \text{and} \quad k = f(h) = c - \frac{b^2}{4a}$$

The optimal value occurs at the vertex of a parabola:

- A maximum if $a < 0$ 
- A minimum if $a > 0$ 

Example. Find the vertex of the following quadratic functions by

- computing h and k , and
- rewriting the quadratic in standard form by completing the square.

Identify if the vertex is the maximum or minimum value.

$$f(x) = 2x^2 - 6x + 7$$

$$= 2 \left(x^2 - \underbrace{3x}_{\frac{b}{a}} + \underbrace{\left(\frac{3}{2}\right)^2}_{+\left(\frac{b}{2a}\right)^2} - \underbrace{\left(\frac{3}{2}\right)^2}_{-\left(\frac{b}{2a}\right)^2} \right) + 7$$

$$= 2 \left(x^2 - 3x + \left(\frac{3}{2}\right)^2 \right) - 2 \left(\frac{3}{2}\right)^2 + 7$$

$$= 2 \left(x - \frac{3}{2} \right)^2 - 2 \left(\frac{9}{4} \right) + 7$$

$$= 2 \left(x - \frac{3}{2} \right)^2 - \frac{9}{2} + 7 \left(\frac{2}{2} \right)$$

$$= 2 \left(x - \frac{3}{2} \right)^2 + \frac{5}{2}$$

Vertex at $\left(\frac{3}{2}, \frac{5}{2} \right)$

$$h = -\frac{b}{2a} = -\frac{-6}{2(2)} = \boxed{\frac{3}{2}}$$

$$k = c - \frac{b^2}{4a} = 7 - \frac{(-6)^2}{4(2)}$$

$$= 7 - \frac{36}{8}$$

$$= \boxed{\frac{5}{2}}$$

$$g(x) = 13 - 3x^2 + 4x$$

$$= -3x^2 + 4x + 13$$

$$= -3 \left(x^2 - \frac{4}{3}x + \left(\frac{4}{2 \cdot 3}\right)^2 - \left(\frac{4}{2 \cdot 3}\right)^2 \right) + 13$$

$$= -3 \left(x^2 - \frac{4}{3}x + \left(\frac{2}{3}\right)^2 \right) - (-3) \left(\frac{2}{3}\right)^2 + 13$$

$$= -3 \left(x - \frac{2}{3} \right)^2 + \frac{4}{3} + 13 \left(\frac{3}{3} \right)$$

$$= -3 \left(x - \frac{2}{3} \right)^2 + \frac{43}{3}$$

Vertex at $\left(\frac{2}{3}, \frac{43}{3} \right)$

$$h = -\frac{b}{2a} = -\frac{4}{2(-3)} = \boxed{\frac{2}{3}}$$

$$k = g(h) = c - \frac{b^2}{4a}$$

$$= 13 - \frac{4^2}{4(-3)}$$

$$= 13 + \frac{4}{3}$$

$$= \boxed{\frac{43}{3}}$$

Example. For the following quadratic functions, find

- the x and y -intercepts,
- the vertex, and
- the domain and range.

$$f(x) = \underline{3}x^2 + \underline{2}x - \underline{4}$$

a b c

x-intercepts: $\left(\frac{-1+\sqrt{13}}{3}, 0\right) \quad \left(\frac{-1-\sqrt{13}}{3}, 0\right)$

↖ ↗

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-2 \pm \sqrt{(2)^2 - 4(3)(-4)}}{2(3)} = \frac{-2 \pm \sqrt{4 + 48}}{6} = \frac{-2 \pm 2\sqrt{13}}{6} = \frac{-1 \pm \sqrt{13}}{3}$$

y-intercept: $f(0) = -4 \rightarrow \boxed{(0, -4)}$

vertex: $\left(-\frac{1}{3}, -\frac{13}{3}\right) \quad f\left(-\frac{1}{3}\right) = 3\left(-\frac{1}{3}\right)^2 + 2\left(-\frac{1}{3}\right) - 4 = -\frac{13}{3}$

Domain: $(-\infty, \infty)$

Range: $\left[-\frac{13}{3}, \infty\right) \quad a = 3 > 0 \Rightarrow \text{min}$

$$g(x) = -(x+2)^2 - 1$$

x-intercepts: $-(x+2)^2 - 1 = 0$

$$-1 = (x+2)^2$$

$$\pm\sqrt{-1} = x+2$$

$$-2 \pm i = x$$

$$\boxed{(-2-i, 0)}$$

$$\boxed{(-2+i, 0)}$$

y-intercept: $g(0) = -(0+2)^2 - 1$

$$= -4 - 1$$

$$= -5 \rightarrow \boxed{(0, -5)}$$

vertex:

$$(h, k) = (-2, -1)$$

Domain:

$$(-\infty, \infty)$$

Range:

$$(-\infty, -1]$$

$$a = -1 < 0 \Rightarrow \text{max}$$

Example. A backyard farmer wants to enclose a rectangular space for a new garden within her fenced backyard. She has purchased 80 feet of wire fencing to enclose three sides, and she will use a section of the backyard fence as the fourth side (see below). What dimensions should she use to maximize the enclosed area?

$$A = W \cdot L$$

$$W + 2L = 80 \rightarrow W = 80 - 2L$$

$$\rightarrow A = (80 - 2L)L = 80L - 2L^2 = \underbrace{-2L^2}_a + \underbrace{80L}_b + \underbrace{0}_c$$

Since $a = -2 < 0$, the area is maximized at the vertex (h, k)

$$h = -\frac{b}{2a} = -\frac{80}{2(-2)} = 20 \text{ ft}$$

$$k = A(20) = -2(20)^2 + 80(20) = 800 \text{ ft}^2$$
